Obiettivi formativi	<p>This course introduces students to a diverse array of theoretical and empirical issues related to the study of human emotion and its interaction with cognitive processes. Although cognition and emotion were classically thought to be two completely independent processes, recent advances in psychology and neuroscience contradict this notion. Recently, scientists have made considerable advances in understanding how cognitive and emotional systems interact in the human brain. Some questions the course addresses include: What are our emotions and what they are for? How do emotions influence and are influenced by our thoughts, memories, and behaviors? The course reviews the most relevant experimental evidence relative to this domain of study.</p>
Programma e contenuti	The course will begin by providing the definition and a description of the

	<p>evolutionary origins of emotions. Then, we will ask how emotions might color cognitive processes, such as, perception, attention and memory. Moreover, possible effects of emotions upon social judgments and decisions will be discussed in the final part of the course.</p>
Metodi didattici	<p>Teaching methods include typical lectures about the interaction between emotion and cognition and practical works. Students will be strongly encouraged to participate in the discussions actively. Students are welcome to suggest topics for the discussions.</p>
Testi di riferimento	<p>Materials (e.g., slides, papers) will be made available during the course.</p>
Modalità verifica apprendimento	<p>For everyone: written and oral exams.</p>
