Prerequisiti	Knowledge acquired in previous courses in Automatic Control and Mathematical Methods in Engineering.
Obiettivi formativi	The course describes and analyzes control schemes which are frequently used at industrial level. It also provides the basics for the design of digital control systems.
Programma e contenuti	<p>Industrial control schemes: Cascade control, open loop control, filtering of the reference signal, compensation of measurable disturbances, two degrees of freedom control schemes, Smith Predictor, decentralized control, relative gain array, decoupling schemes.</p> <p>PID controllers</p>

Metodi didattici	Features and properties. Rules for the empirical calibration. Wind-up and anti wind-up schemes.
Testi di riferimento	<p>Digital control: Discrete-time systems. The concept of equilibrium for discrete-time systems. Stability. Stability of linear time-invariant discrete-time systems. Jury test. Digital control schemes. Sampling problem. Choice of the sampling time. Discretization of continuous-time controllers. Euler and Tustin methods.</p> <p>Lectures (hours/year in lecture theatre): 45 Practical class (hours/year in lecture theatre): 0 Practicals / Workshops (hours/year in lecture theatre): 0</p>
Modalità verifica apprendimento	<p>Lecture notes</p> <p>Paolo Bolzern, Riccardo Scattolini, Nicola Schiavoni. Fondamenti di controlli automatici. McGraw-Hill, Milano. (In Italian).</p> <p>Carlos A. Smith, Armando B. Corripio. Principles and Practices of Automatic Process Control. John Wiley and Sons.</p> <p>Closed-book, closed-notes, 2 hour written exam consisting of 1-2 sections assessing knowledge and understanding of the course topics and ability to apply them in a problem solving context. Each section will be independently graded. Threshold to pass is 18/30 an maximum mark is 30/30 cum laude. The final mark is obtained as the weighted mean of marks given to each section of the written exam.
