

UNIVERSITÀ DI PAVIA

Anno Accademico 2018/2019

DIGITAL IC DESIGN

Anno immatricolazione	2018/2019
Anno offerta	2018/2019
Normativa	DM270
SSD	ING-INF/01 (ELETTRONICA)
Dipartimento	DIPARTIMENTO DI INGEGNERIA INDUSTRIALE E DELL'INFORMAZIONE
Corso di studio	ELECTRONIC ENGINEERING
Curriculum	Microelectronics
Anno di corso	1°
Periodo didattico	Secondo Semestre (06/03/2019 - 14/06/2019)
Crediti	6
Ore	70 ore di attività frontale
Lingua insegnamento	English
Tipo esame	SCRITTO E ORALE CONGIUNTI
Docente	TORELLI GUIDO (titolare) - 6 CFU
Prerequisiti	Fundamentals of Logic Circuits, Basics of Electrical Engineering, Electronics, Basics of Digital Electronics, Basics of CMOS Logic Gates and Integrated Circuit Technology. Additional lectures can be agreed with interested students to refresh missing background prerequisites.
Obiettivi formativi	<p>The main objective of the course is to provide the student with the basics of circuit design for combinational and sequential logic in CMOS technology and the operating principles of semiconductor memories. Theoretical lessons will be followed by practical classes in lecture theatre for detailed analysis and exercises, as well as by computer laboratory sessions, during which the student will use SPICE-based computer simulation to analyze basic digital circuit blocks. A few seminars on specific topics will also be provided. At the end of the course, the student is expected to be able to design and analyze basic digital circuit blocks and architectural solutions in CMOS technology as</p>

well as to evaluate their performance.

Programma e contenuti

Digital gates in CMOS technology
Review of the MOS transistor. Review of inverter and combinational logic gates in CMOS technology. Transistor sizing of CMOS logic gates. Evaluation of rise time, fall time, and delay time of CMOS logic gates.

Circuit performance estimation

Estimation of parasitic electrical parameters (resistance, capacitance, inductance). Distributed RC effects of interconnect lines. Ring oscillator. Speed performance analysis of logic gates. Buffered structure for heavy capacitive loads. Power consumption estimation. Power consumption reduction techniques. Design margins. Sizing of interconnect lines. Pass transistor logic. Shrinking and technology scaling down.

Circuit design in CMOS technology

Design strategy for combinational logic. Dynamic CMOS logic; precharge logic; domino logic; clocked CMOS logic. Clocked sequential systems. Review of basic static memory elements (latch, flip-flop). Single-phase and two-phase timing. Dynamic memory elements. Synchronous systems. Pipeline architecture. Clock distribution in digital integrated circuits. Clock skew in synchronous systems. Remarks on low-power digital circuit design.

Semiconductor memories

Introduction to semiconductor memories. Memory types. Organization of a memory. Row and column address circuits. Review of volatile memories (static RAM, dynamic RAM). Content addressable memory (CAM). Non volatile memories: ROM, Flash memory; emerging non volatile memories: phase change memory. Charge pump based integrated voltage elevators.

Metodi didattici

Lectures (hours/year in lecture theatre): 22

Practical class (hours/year in lecture theatre): 30

Practicals/Workshops and Seminars (hours/year in lecture theatre and computer lab): 18

Notes by the lecturer on specific topics will also be provided during the course.

**Modalità verifica
apprendimento**

Written examination (exercises) and oral examination (theory). Relative weight: written examination 1/2, oral examination 1/2.
